Introduction

Dear customers, partners and agents.

In this newsletter we will present you what the differences are between our TRIKNO ColdPress 1.0 and 2.0.

TCP – TRIKNO ColdPress

Precision in shaping chocolate shells.

The TRIKNO ColdPress works with a proven Z-stroke drive and fully electrically operated servo motors. The precise head movement enables reliable and constantly reproducible forming.

With the stroke of **150 mm**, a wide variety of shell shapes and sizes can be realized. The mould centring can be easily adjusted and allows quick adaptation to different applications.

Depending on the mould size, the output of up to 15 moulds/min for one press plate and up to 30 moulds/min for two press plates is possible.

To keep the humidity in the press chamber constant, an integrated dehumidifier is included.

ColdPress 2.0

Fewer process steps. More efficiency.

The ColdPress 2.0 brings decisive advantages for the industrial production of chocolate shells.

The new **compressed air padding** of the punches compensates for differences in dosing accuracy and at the same time forms a **form-fitting edge geometry** in a single step, which makes subsequent rim cutting superfluous.

Another advantage is that **there is no need for a second ColdPress for the subsequent book moulding,** because the melt edge can be mapped in the pressing process. This makes the process more compact and reduces the number of machines required.

Your benefits

- **No rim cutting required** due to form-fitting edge geometries
- **No need for a second ColdPress for book moulding**
- **Compensation of depositing inaccuracies** through compressed air cushioning
- **Quick changeover** of different press tools
- **Precise and reproducible head movement** by electric servo motors
- **Easy mould centring** for quick adjustments
- **Sealed safety casing** for minimal cold loss
- **Easy to clean** without additional tools
- **Absolutely no water absorption**

Proven technology

ColdPress 1.0

The ColdPress 1.0 is based on a technology that has proven itself in production for more than 30 years (1995).

Each cavity is moulded with the same weight. Together with the precise electric head movement and the easily adjustable mould centring, a reliable and reproducible process is created. The shells produced have identical wall thicknesses.

The machine is fully digitally controlled and has a 15" touch-screen HMI for intuitive operation.

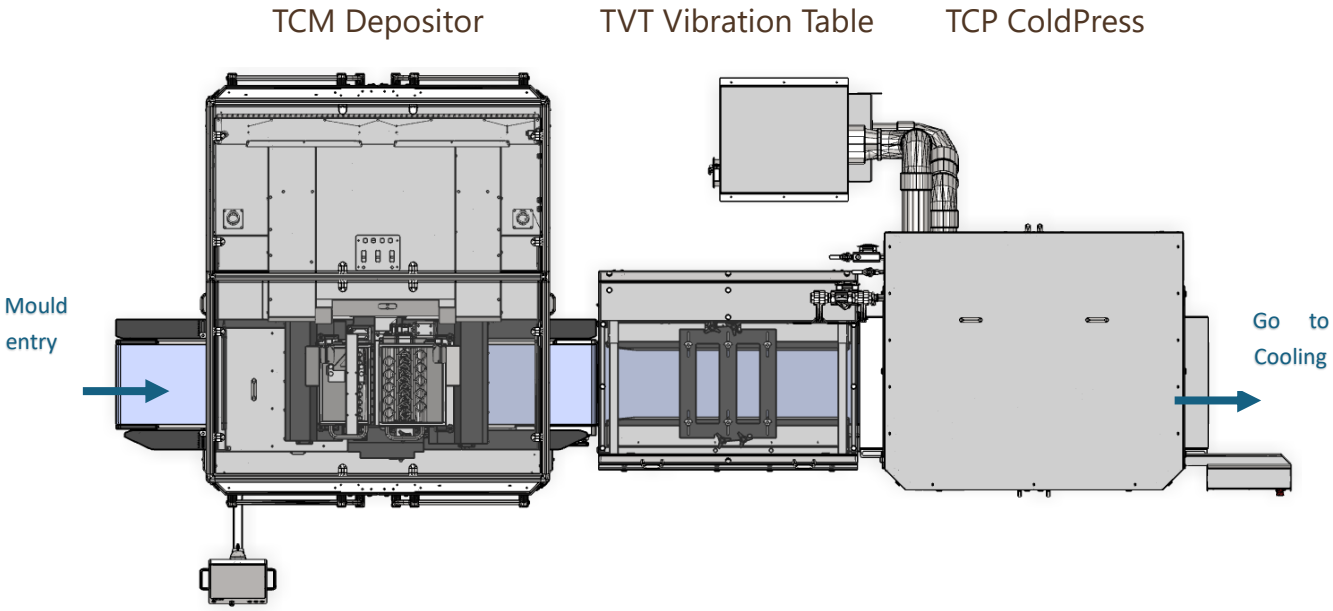

ColdPress 1.0 or 2.0

Find the right solution for your application

ColdPress 1.0	ColdPress 2.0
Stamp temperature -2 to -12°C	Stamp temperature -10 to -20°C
Proven for more than 30 years	Advanced ColdPress Technology
Same weight per cavity (identical shell wall thicknesses)	Compressed air cushioning to compensate for dosing accuracies (with conventional third-party systems)
Precise electric Z-stroke drive	Precise electric Z-stroke drive
Easily adjustable mould centring	Easily adjustable mould centring
Quick changeover of the press tools	Quick changeover of the press tools
Proven solution for chocolate shells	**No intermediate cooling** before rim cutting
-	**No rim cutting** required
-	**No need for a second ColdPress** for book moulding

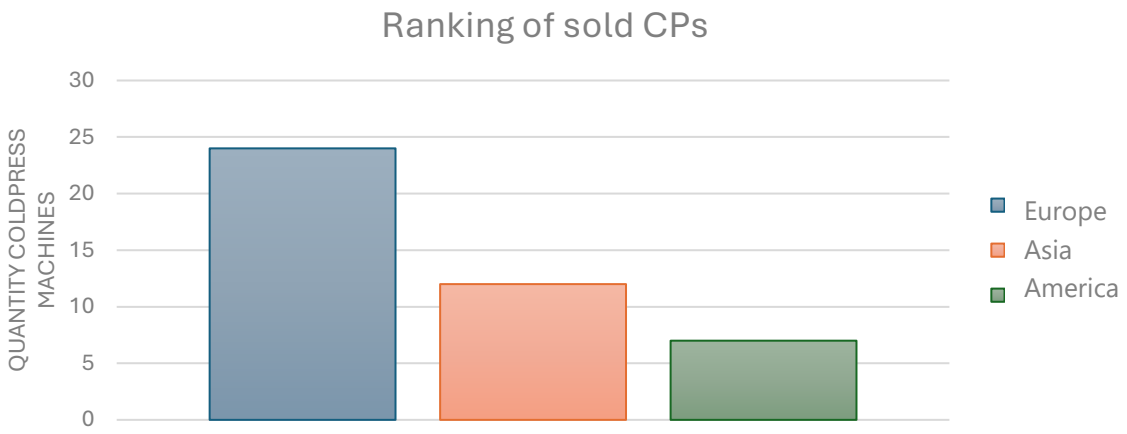

Link to CP 2.0 video

Minimal construction of a CP 2.0 small plant consisting of

Examples of implemented CP lines worldwide:

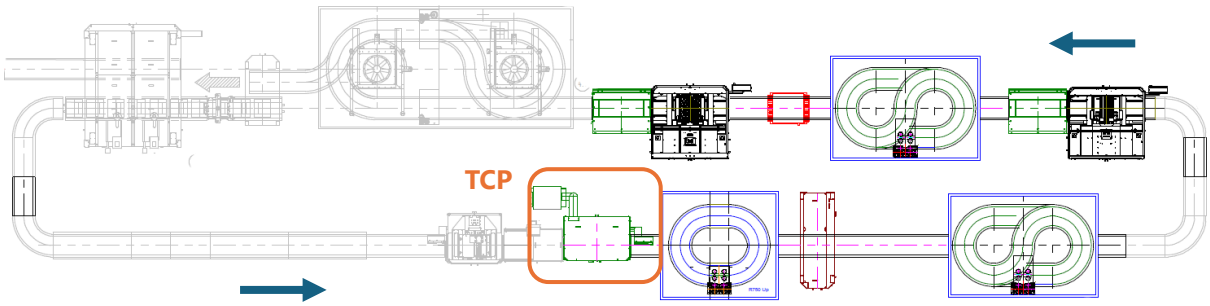

Since 1995, more than 40 ColdPress have been successfully put into operation in the production facilities of our customers worldwide.

Investment examples

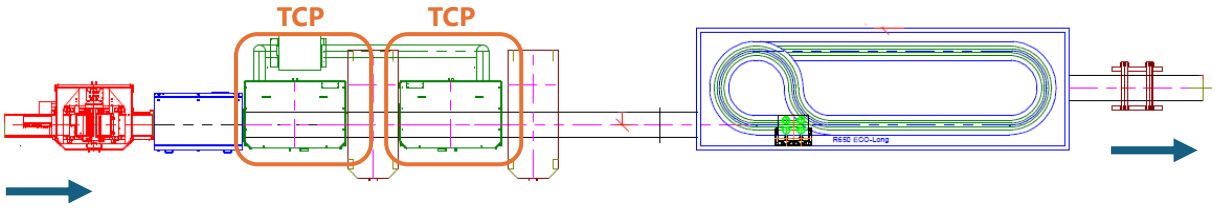

a) Extension of an existing line

In this example, we have added a one-shot line so that the customer can now also produce filled shells. This was achieved by moving the conveyor belt and adding the following system elements: 1x TCP ColdPress, 2x TCM Alpha, 2x TVT vibration table, 3x TCS cooling spiral, 1x THS rim cutter, 1x IR heater. This was possible because the necessary space was available in the hall.

b) New classic Book-mould (monobloc) semi-automatic line

In this example, the customer wanted to produce precise hollow figures. For this purpose, we provided him with the following system elements: 1x TCM Alpha, 1x TVT vibration table, 2x TCP ColdPress, 1x THS rim cutter, 1x IR heater, 1x THS mould turner, 1 x TCS cooling spiral. At this customer's site, the empty moulds are inserted manually and the full moulds are processed manually for packaging.

Digital control

Precise. Flexible. Remotely maintainable.

Both ColdPress variants have a **fully digital machine control system** and a 15" touch-screen HMI.

The specially developed software enables precise and clear operation. If required**, remote maintenance of PLC, HMI and servo drives** is also possible.

This ensures a high level of process reliability and facilitates service and support.

Individually configurable

Suitable for your production line

The TRIKNO ColdPress can be adapted to different production conditions and system concepts.

Available variants:

- CP 1.0 or CP 2.0
- HMI operation left or right
- Belt running direction from left to right or from right to left
- LAN or Wi-Fi modem
- 1 or 2 pressing plates

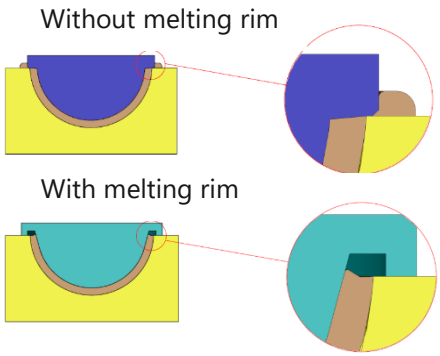

For a wide variety of chocolate shells

The ColdPress is suitable for **shells in various sizes and shapes** – with or without a melting rim for 3D products.

The TRIKNO ColdPress thus offers a flexible solution for different products and production requirements.

Your benefits at a glance

150 mm	Z-stroke for precise head movement
15"	Touch-Screen HMI
100 %	Same weight per cavity with ColdPress 1.0
5%	Weight compensation in ColdPress 2.0
30+ years	Proven ColdPress technology
Fully digital	Control with remote maintenance option

Precise pressing. Efficient production.

Whether it's the tried-and-tested ColdPress 1.0 or the further developed ColdPress 2.0: TRIKNO offers the best solution for your application.

Are you planning a new production of chocolate shells or would you like to optimize your existing system? **Talk to our experts – together we will develop the right solution for your production line.**
